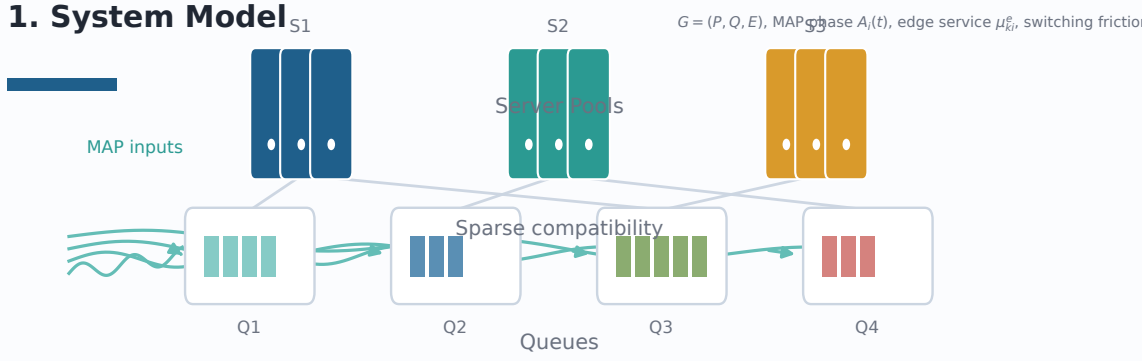
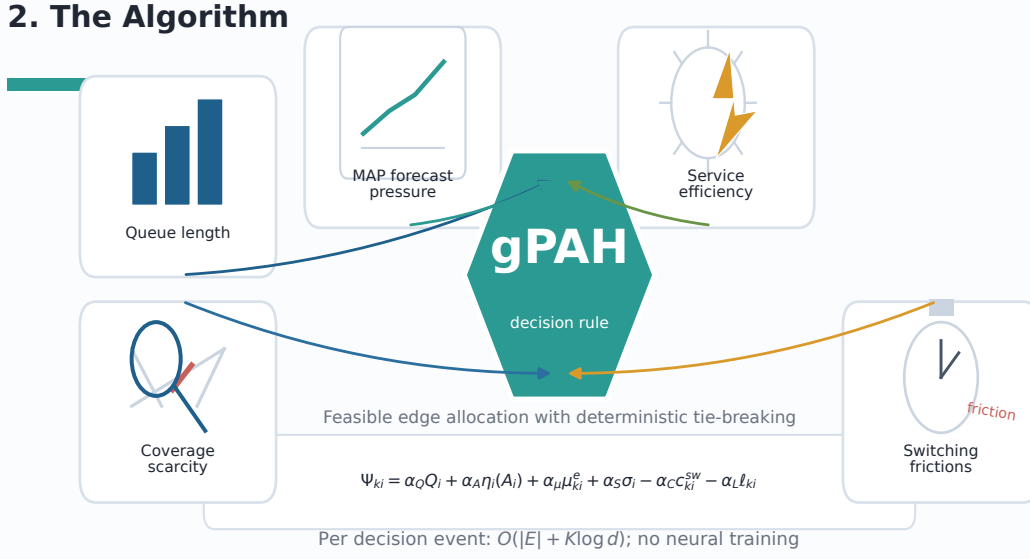
Generalized Phase-Aware Heuristic

Sparse MAP service networks with edge service heterogeneity and switching frictions

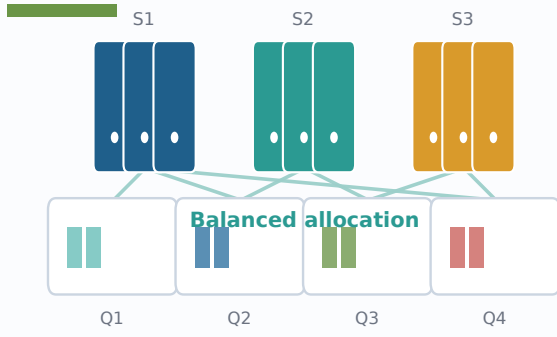
1. System Model



2. The Algorithm



3. Computational Conclusions



Paired improvement over strong baselines

	gain	wins
MaxWeight-mu	+13.3%	35/38
Affinity	+11.5%	30/38
QAH+Switch	+13.6%	30/38

Key conclusions from the paper

- **A1-A8:** topology, MAP, density, service, switch, load, scale
- **Scale:** competitive up to $d = 100, K = 40$
- **RL:** DQN/PPO/SAC not consistently better
- **Ablation:** queue is base; other terms are mechanism-matched
